IAP Statement on Science Education
04 December 2013

Must all children learn science at school?

The answer is “Yes.” Science opens young people’s minds to the wonders of the natural world; introduces them to the elegance and honesty of scientific endeavours; and equips them with cognitive and problem-solving tools that will serve them well in the future. Science brings children closer to the natural objects and phenomena that surround them; endows them with a rich understanding of our complex world; helps them practice an intelligent approach to dealing with the environment; and teaches them about the techniques and tools that societies have used to improve the human condition. As children become familiar with the universality of the laws of science, they also learn to recognize science’s ability “to create and cement together a unity for humanity.”

As citizens, science helps children develop the mental and moral predispositions to imagination, humility, rigour, curiosity, freedom and tolerance - all essential ingredients for peace and democracy.

Therefore, the InterAcademy Panel on International Issues (IAP) recommends to all national leaders that:

1. teaching of the sciences to both girls and boys begin in their primary and nursery schools. There is evidence that children, from the youngest age, are capable of building upon their natural and insatiable curiosity to develop logical and rational thought;

2. this teaching should be closely tied to the realities with which the children are confronted locally, in their natural environment and their culture, in order to facilitate continuing exchange with their family and friends;

3. this teaching should be based, to a large extent, upon models of inquiry-based pedagogy, assigning a major role to questioning by the students, leading them to develop hypotheses relating to the initial questions and, when possible, encouraging experimentation that, while simple in terms of the apparatus used, can be performed by children themselves;

4. in this manner one should avoid, as far as possible, a teaching of the sciences which is handed down vertically by a teacher enunciating facts to be learnt by heart, in favour of one which is transformed for children into an acquisition of knowledge which is horizontal, that is, which connects them with nature - inert or living - directly, at the same time involving their senses and their intelligence;
5. links should be established between teachers, via the internet, first within their own country, then internationally, taking advantage of the universal nature of the laws of science to establish a direct contact between classes in different countries on subjects of global interest (e.g. climate, ecology, geography);

6. priority should be given to the networking of schools, and that support should be given - in the same way as IAP and the International Council for Science (ICSU) work on this jointly via the website: http://www.icsu.org/events/icsu-iap - to efforts to develop shareable experiments and teaching tools (such as documents and experiment portfolios) to be placed in an electronic commons for all to modify and use.

We, the undersigned science academies throughout the world, members of the IAP, are convinced that, with the support of international authorities, the backing of the national ministries concerned, and the dedicated efforts of the many scientists whom they bring together, a worldwide effort in this area is within reach. This effort is potentially rich in intellectual and societal benefits.
