To 1m resolution

Where are we headed at WIFIRE?

- **Wildfire Response:** WIFIRE's *Firemap platform* in collaboration with CALOES and CAL FIRE through California's Fire Integrated Real-Time Intelligence System (FIRIS) and with partners in Colorado
- **Community Data Platforms:** WIFIRE's *Wildfire Science & Technology Commons* and *Wildfire and Landscape Resilience Data Hub* to develop standards, tools and techniques to share data and data-driven models with partners including NIST, CAL FIRE, and SDGE
- **Beneficial Fire:** WIFIRE's *BurnPro3D platform* for prescribed burn planning and implementation in collaboration with 3D fuel and fire modeling efforts at USGS, DOD, USFS, and LANL
- **Immersive Fire Environment:** WIFIRE's *Immersive Forest Project* leverages the AI-readiness of scientific data for new modes of teaching, training, decision-making, and public communication,
- Our platforms and products are fueled by over a dozen research projects and partnerships focused on *moving science to practice*

Focus on Two Ways to Manage Wildland Fires

 FIREMAP

PROACTIVE

Fighting Severe Wildfires

Conducting Prescribed Burns

Wildfire Response

FIREMAP

<https://firemap.sdsc.edu>

Firemap is currently being used by firefighters in Colorado, in collaboration with Intterra, and firefighters in California through the FIRIS program under the California Governor's Office of Emergency Services and CALFIRE.

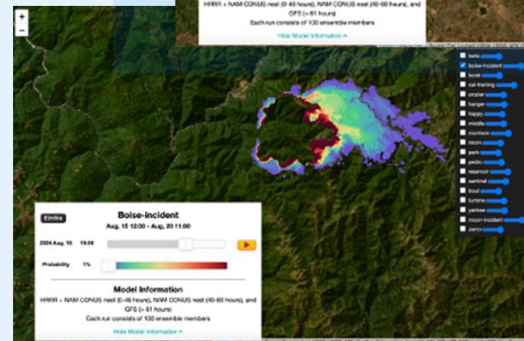

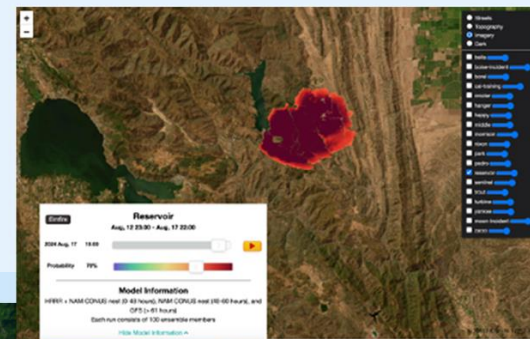

REACTIVE

FIRIS uses Firemap to provide real-time information on weather conditions and fire ignitions and to monitor and predict direction and speed of fire spread, as well as communities at risk. It has revolutionized initial attack response for the most dangerous fires across California.

OF EMERGENCY SERVICES

AI and Computing Needs for Dynamic Data-Driven Fire Modeling

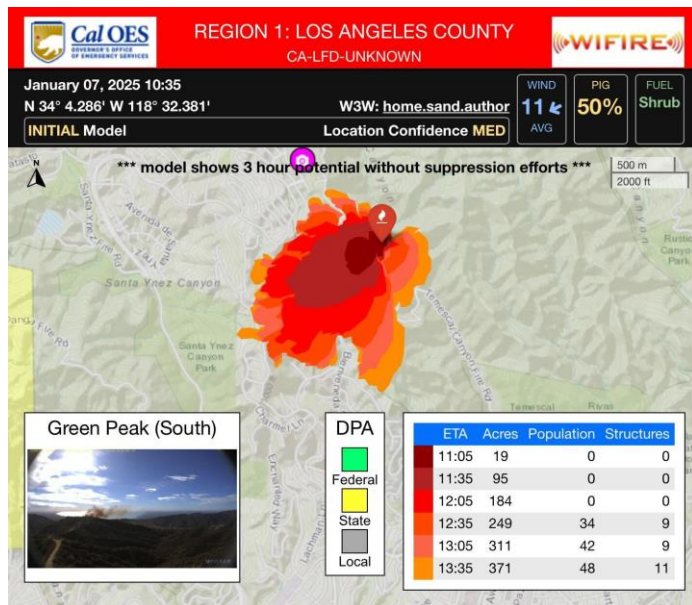

- Characterizing the dynamic fire environment :
Variation of wind, smoke, moisture, fuels, fire perimeter, ...
- Detection of fire ignitions
- Decision support for fire management
- Prediction of potential fire ignitions

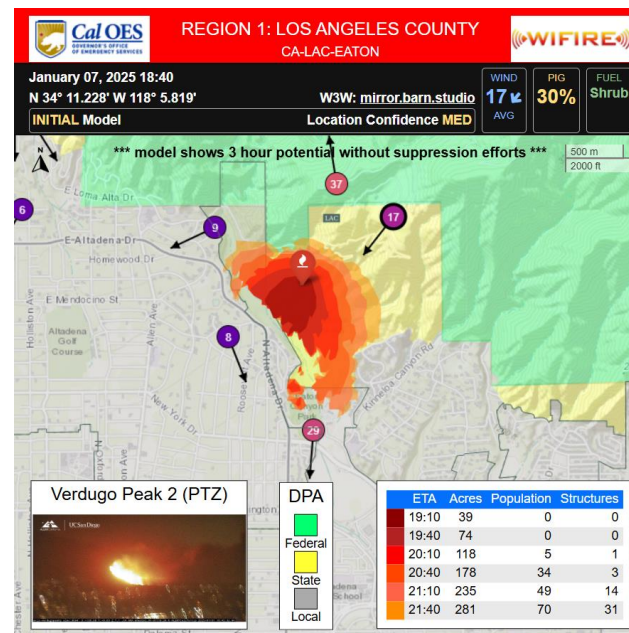

January 2025 LA Firestorms

Initial Attack Fire Model

230 total!

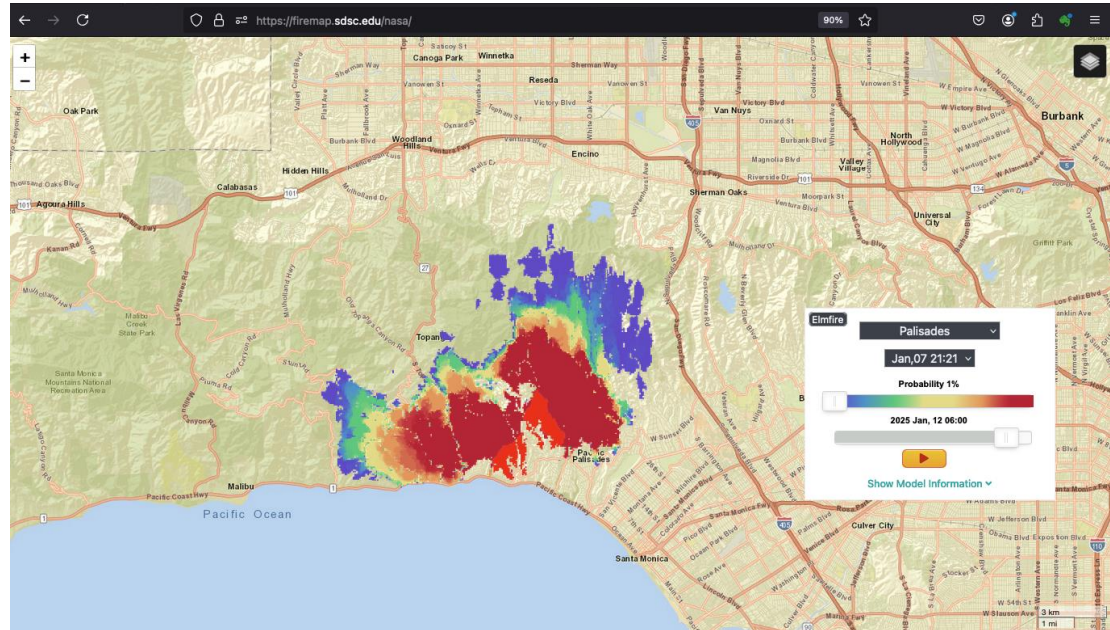

All 2025 fires in the area... in contrast to prior fires

NASA-funded Long Term Fire Model Deployment

The ELMFIRE predictive model runs probabilistic fire forecasts for multiple days, initiated when an official perimeter is reported. Red is highly probable and blue is a 1% chance of occurrence.

Palisades: The Palisades Fire began the morning of January 7th. On January 8th, Cal OES Fire and Rescue shared the probabilistic forecast to the Advanced Planning Unit of OES for strategic decision support. They were relieved to have the forecast (right) which shows the lower probability forecast which came to fruition that day.

The bright red center is the official fire perimeter at the time the model was run,

In alignment with the nation's goal to increase fuel treatments to reduce wildfire risk, BurnPro3D is designed to support the preparation of burn plans as well as the implementation of

PROACTIVE

burns. The interface allows burn bosses to create and visualize high-resolution 3D fire simulations and compare fuel consumption and risk under different weather and ignition scenarios. It uses 3D FastFuels data developed by the US Forest Service and the QUIC-Fire coupled fire/atmosphere model developed at Los Alamos National Lab.

Emerging AI Needs for Next Generation Fire Modeling

- High-res, 3D and dynamic fire environment data
- Speed, flexibility, and interpretability of fire models

AI Techniques to Condition Data and Improve Model Accuracy

Altıntaş, “Visualization and Labeling of Terrestrial LiDAR Data for Three-Dimensional Fuel Classification,” in Proceedings of the IEEE eScience 2023 Conference, 2023, pp. 1-2. doi: 10.1109/eScience.58273.2023.10254841.

Immersive Forest for Multimodal Communication

Terrestrial LiDAR contextualized
within Aerial scan

Many Scientific Data Types in Digital Twin

Topologies: 1D/2D/3D - Uniform, Rectilinear, Structured, Unstructured, Polygonal, Polyhedral, AMR

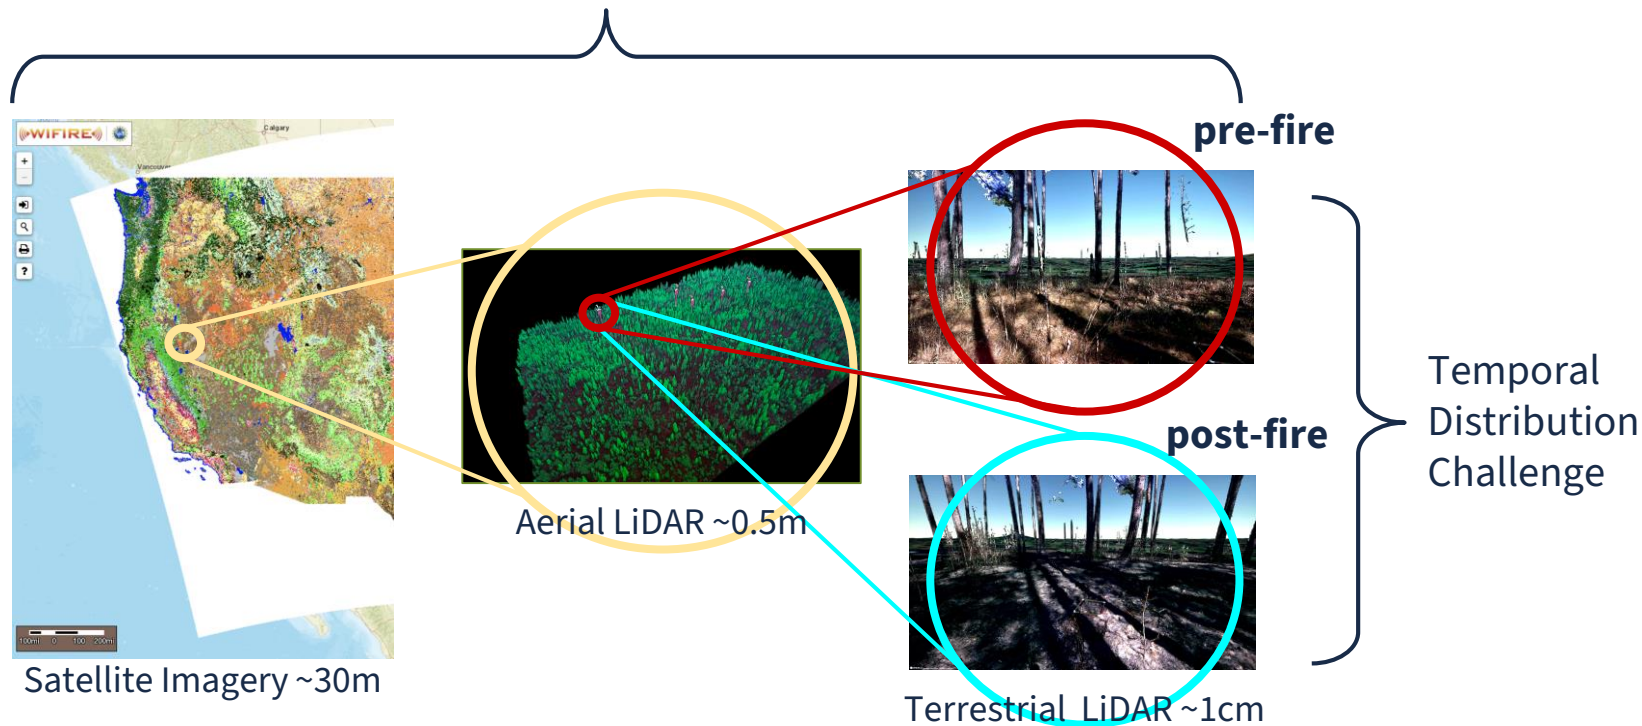

Fields: Scalar, Vector, Multi-material

Spatiotemporal Data Challenges

Multiscale Spatial Challenge

Next generation fire science needs data from many sources.

Ground-based real-time weather and camera imagery

Weather forecast and modeling

Fire perimeters

Landscape data

Remote sensing and aircraft data

Land cover and fuel

Field data

Such diverse data comes with pain points to overcome!

How do we go from these challenges to:

- Standardized collaborative data infrastructure?
- Rapid solutions?

Embrace open science and data through a commons approach!

INTRODUCING THE WILDFIRE TECHNOLOGY COMMONS

We believe that avoiding devastating wildfires requires urgent, innovative, and collaborative solutions. The Wildfire Technology Commons is a bold new initiative designed to accelerate technological innovations for wildfire management and mitigation. We are building a community platform around open data, cutting-edge science, AI, and shared knowledge.

Toward a Collaborative Wildfire Commons

GENERATE

- Data and models generated by **stakeholders** for a specific purpose

SERVE

- Data and models served via a **common infrastructure**
 - ❖ Ingestion
 - ❖ Curation
 - ❖ Integration
 - ❖ Findability
 - ❖ Accessibility
 - ❖ Executability
 - ❖ Interpretability
 - ❖ AI Readiness

(RE-)USE

- Data and models used by **community** to create new science and technology solutions

Are there risks to open data and models?

Advantages

- Transparency
- Collaboration
- Innovation
- Accountability
- Cost savings

Risks

- Security
- Misinterpretation
- Liabilities
- Economic concerns, e.g., insurance loss

Manageable through cybersecurity, public education, standardization, communication, ...

The Benefits Outweigh the Risks — If Proper Controls Are in Place...

Balance openness with responsible data governance!

Community Data Platforms

Wildfire Science & Technology Commons

A central hub for data, models, computing resources, and expertise to enable wildland fire researchers to collaborate with each other and practitioners to move quickly from theoretical ideas and experimental

NIST

workflows to impactful, scalable real-world solutions. For example, it enables an integrated fire weather intelligence platform focused on reducing risk related to power lines for Southern California. A new phase of development was recently supported through congressionally directed spending proposed by California Sen. Padilla, Rep. Vargas, and Rep. Jacobs.

Wildfire and Landscape Resilience Data Hub

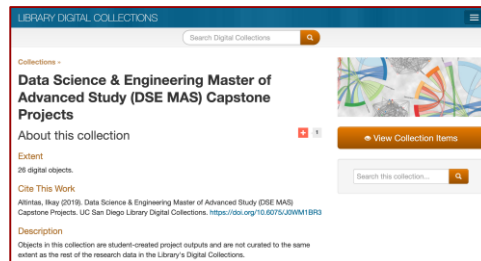

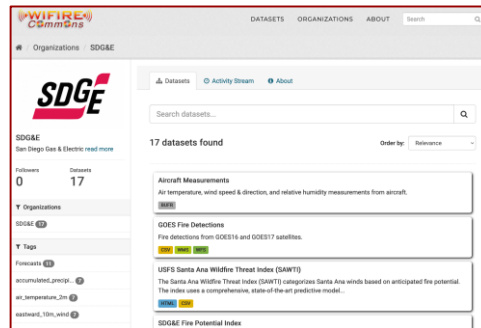

The Data Hub is a federated data ecosystem for California's Wildfire and Forest Resilience Task Force, providing a "single view" over existing data to fulfill the reporting requirements for California's

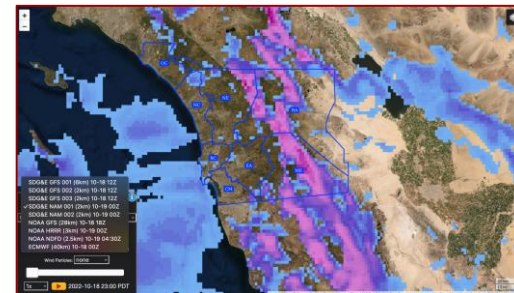

Million Acre Strategy to treat 1 million forested acres per year to reduce wildfire risk. It will provide public, open, and fair access to data, analytic tools, and customizable reports via the Data Hub explorer web viewer, as well as access to data through APIs.

Description

Next generation

Physics-Guided Machine Learning for Fire Spread Prediction

- Deep learning models to predict how fuel density changes over time
- Incorporate physics constraints: Apply penalty term if fuel density increases in model's prediction
- Platform for experiment tracking & analysis

Couple of closing points...

Data and tech is a means to an end – let's not forget our objectives

- *The potential for new technology built on data and science is unparalleled, as are the challenges in fire modeling and management.*

"ACTION SPRINGS NOT FROM THOUGHT, BUT FROM A READINESS FOR RESPONSIBILITY."

Dietrich Bonhoeffer

Data and tech needs to be harnessed

- *We need to start with insights learned through operational experience within proven workflows for decision making.*

Let's not forget about science basis for tech

- *Open science and open data needs to be supported.*

New business models for building new solutions together

- *Slow but steady cultural shift is happening.*

Challenges around data, models and culture hinders scalable solutions and collaborative thinking!

- Too much data without value in decision making
- Lack of standards and transparency
- Poor data quality, governance and availability
- Siloed data storage findability, and accessibility
- Undefined process for data ingestion, curation, use and reuse
- Limited interoperability and feedback between practice and research
- Culture toward one size fits all fire and weather modeling
- Difficulty to access and switch between alternative models
- Reliance on often expensive closed box integrated products

More questions...

- How can data be standardized to help integration, collaboration, interoperability and reuse?
- How does data become AI-ready so we can accelerate use of AI?
- How we make data useable, timely and interpretable by decision-makers?
- How can new multiple data sources and models be used together or interchangeably?
- How can open things be sustained into the future?
- ...
